Atty Dkt. No.: STAN-235CIP

USSN: 10/663,497

## In the Claims:

1. (currently amended) A method for the diagnosis of diagnosing a human individual's predisposition to an atopic immunological disorder, the method comprising:

analyzing said individual for the presence of at least one TIM-1 polymorphism <u>by</u> contacting a biological sample comprising nucleic acids from said individual with a <u>probe that specifically binds under stringent conditions to the nucleic acid sequence of a TIM-1 gene;</u>

wherein the presence of said polymorphism is indicative of an individual's predisposition to develop said <u>atopic</u> immunological disorder.

2. (withdrawn) The method according to Claim 1, wherein said analyzing step comprises:

contacting a biological sample comprising nucleic acids from said individual with a probe that specifically binds to one or more of the sequences set forth in SEQ ID NO:18, 20, 22, 24, 26, and 28 or a fragment thereof; and

detecting the presence of a complex formed between said probe and said nucleic acid.

- 3. (withdrawn) The method according to Claim 4, wherein said biological sample comprises nucleic acids specifically amplified with sequences set forth in one or more of SEQ ID NO:18, 20, 22, 24, 26, and 28 or a fragment thereof.
- 4. (previously presented) The method according to Claim 1, wherein said analyzing step comprises contacting a biological sample comprising nucleic acids from said individual with a probe that specifically binds to the nucleic acid sequence ATGACAACGACTGTTCCA encoding the amino acid sequence MTTTVP, SEQ ID NO:25, residues 158-163; and

detecting the presence of a complex formed between said probe and said nucleic acid.

5-6. (canceled)

7. (original) The method according to Claim 1, wherein said biological sample is blood or a derivative thereof.

Atty Dkt. No.: STAN-235CIP

USSN: 10/663,497

8. (currently amended) The method according to Claim 1, further comprising the step of: analyzing said individual for the presence of hepatitis A virus (HAV) seropositivity

wherein said seropositivity in said individual expressing an allele of TIM-1 comprising the amino acid sequence MTTTVP, SEQ ID NO:25, residues 158-163 is indicative of a reduced risk of developing atopy.

9 - 19. (canceled)

20. (new) A method of diagnosing a human individual's predisposition to an atopic immunological disorder, the method comprising:

analyzing said individual for the presence of at least one TIM-1 polymorphism by contacting a biological sample comprising nucleic acids from said individual with a probe that specifically binds to a nucleic acid sequence encoding the amino acid sequence MTTTVP, SEQ ID NO:25, residues 158-163;

wherein the presence of said polymorphism is indicative of an individual's predisposition to develop said atopic immunological disorder.

- 21. (new) The method according to Claim 20, wherein said biological sample is blood or a derivative thereof.
- 22. (new) The method according to Claim 20, further comprising the step of: analyzing said individual for the presence of hepatitis A virus (HAV) seropositivity, wherein seropositivity in an individual expressing an allele of TIM-1 comprising the

amino acid sequence MTTTVP, SEQ ID NO:25, residues 158-163 is indicative of a reduced risk of developing atopy.

, 5 . ,

23. (new) A method of diagnosing a human individual's predisposition to an atopic immunological disorder, the method comprising:

analyzing said individual for the presence of at least one TIM-1 polymorphism by contacting a biological sample comprising nucleic acids from said individual with a probe that specifically binds under stringent conditions to a polymorphism in exon 3 of a TIM-1 gene;

Atty Dkt. No.: STAN-235CIP USSN: 10/663,497

wherein the presence of said polymorphism is indicative of an individual's predisposition to develop said atopic immunological disorder.
